seaPilot — Declarations

Team seaLion · Sea x OpenAI Regional Codex Hackathon Vietnam · 31 Oct 2026

Repo: https://github.com/Phonghigh/seaLion-codex-hackthon-sea-openai (new public repository, first commit 31 Oct 2026 09:11, Asia/Saigon)

1. Existing projects

We did not build on any existing personal, company or open-source project. No product code was written before the event.

2. Prepared before the event (text only, no code)

- Product brief and demo story.
- `AGENTS.md`, the architecture notes, the build task prompts and the AI runtime prompt, as text files. They are in the repo under `AGENTS.md`, `docs/` and `prompts/`.
- Demo data described as text (customers, orders, parcels, messages) in `prompts/04-demo-data.md`.
- The preparation documents were drafted with the help of an AI assistant and reviewed by the team.

3. Built during the hackathon (31 Oct 2026, on site)

All of the following, with the commit history and `docs/codex-log.md` as evidence:

- application code, database schema, migration and seed;
- the AI tools, agent loop, triage and routing;
- both user interfaces and the API;
- tests;
- deployment to ChatGPT Sites;
- the backup demo video and the pitch materials.

4. AI tools used

- **OpenAI Codex** (primary): built the product from our task prompts and published the Sites. Codex usage is recorded by hooks in `docs/codex-usage-report.md`, and per-task entries are in `docs/codex-log.md`.
- **Claude Code** (Anthropic): used by one team member in the afternoon for a small set of changes, each in its own commit:
  - switching the demo data to English;
  - the product icon;
  - fixes for three UI bugs found in manual testing;
  - automatic refresh of an untouched AI draft;
  - one-click sample messages for the demo.

  It was also used to help draft this write-up, the pitch script and the demo narration, and to apply wording and layout fixes to the slides.
- **OpenAI API** (Responses API): the model used by the product at runtime.

5. Third-party services and libraries

Used as normal dependencies, not as a base project:

- Next.js, React, Tailwind CSS, shadcn/ui
- Hono, Drizzle ORM, PostgreSQL (Docker), Zod, Vitest
- ChatGPT Sites (hosting), Cloudflare Tunnel
- Canva (slides)

6. Data

All customer, order and shipment data is fictional.
